

Cella seed document

This PDF is part of the seed data set. It renders in the attachment sheet through the PDF viewer, which reads it with HTTP range requests, so the bucket's CORS rules have to allow the origin your frontend runs on.

Page one is also what the thumbnail column shows: the upload pipeline renders the first page to a PNG preview, and the seed ships that preview alongside the original.

Section 1. What the seed covers

An image, a photo, this document, a plain text file and a CSV. Together they cover the image, document and passthrough branches of the attachment upload template.

Section 2. Where the files live

Shared public development bucket, prefix seed/v1/. Objects under a published prefix are immutable; a changed set ships under the next version prefix.

Section 3. Verifying

Open the attachments table, confirm thumbnails render, open this file and scroll .
